And just for grins, you can superimpose the new Eastmark Housing development on that plume map figure as well.

This would be a useful figure from a prior dispute on Williams for developing modeled future plume maps for ST12. This also might explain the northeastern groundwater trend we've been seeing. Maybe we should ask ADWR or City of Mesa about pumping rates as input for fate and transport model?

Thanks everyone for your efforts with this. I just got off of the phone from briefing Enrique. He is very interested in your model conclusions, but has a follow up question that will require additional modeling effort. He wants to know given the slow degradation rate predicted by the model, can we also link a transport model to show growth of groundwater plume over the predicted timeframe?

I added my edits to Eva's version (attached). I believe I addressed a few of her comments and a couple of Dan's. I regret that I wasn't able to add my comments to Bo's original version before sending out yesterday; hence, all of the red-line. (Bo also needs to make sure he is OK with the changes I made).

Maybe we need to an updated "clean" version for Dan to make some of his edits and for Eleanor to look at?

A couple of comments, most of which are not actionable, added to Eva's comments.

I'm looking at this summary again this morning and will try to address as many of Eva's comments as I can.

Hi All,

Attached is the summary that Doug and I came up with. I also added an outline and made some edits to make the memo a little more readable. That is also attached. Please comment on/edit the summary to make it more understandable. We added some interpretative language that does not appear in the memo to get the point across although held back adding that these time estimates are still optimistic as they assume the degradation goes flawlessly.

Bo
